Dear Riverkin team,

I build hardware-software products from 0 to 1 and stay in the code, which is exactly what this role asks for.

At Dronistics I was the founding engineer for an autonomous drone-and-sensor system: I built the AWS cloud backend, the data pipelines from sensor ingestion to usable outputs, the APIs, and the MVP frontend, then took it into the field with real clients (500+ deliveries, 99.5% safety, a Unilever partnership, a CES showcase) and toward industrialization. That is your problem shape: real hardware, real data, real customers, and the messy gap between a working prototype and a reliable product. My roots are in hardware too (two embedded-systems MSc degrees, an electronics background, a TI analog-design award), so I can sit with your hardware and hydrology teams and translate between sensors, models, and software without a gap.

I lead like a builder, not an optimizer. I would start by taking what you already have (a Python backend, AWS on Terraform, SQLite, a JS frontend already in clients' hands) and deciding what to keep, fix, or redesign, rather than rebuilding for its own sake. I optimize for a usable, customer-facing MVP fast, then a pragmatic path to scale and industrialization that fits your stage. I have made these calls as a tech lead at Beekeeper (owned architecture for products used by 10M+ users, led three teams, hired and grew engineers, made the build-vs-buy calls) and across three companies I founded.

I am based in Zurich, hands-on, and comfortable owning the roadmap end to end while keeping the team aligned and moving. I would love to help turn Riverkin's sensors and models into a product customers depend on.

Thanks for reading,

Anand Bhaskaran
