3	10M+	500+	\$337K
Companies Founded	Users Served	Sensor/Drone Deliveries	Costs Eliminated

Hands-on technical leader and three-time founder who takes products from 0 to 1 and stays in the code. I have shipped hardware-software systems for the real world: at Dronistics I built the cloud backend, data pipelines, APIs, and MVP frontend for an autonomous sensor-and-drone fleet, from field deployment through 500+ real deliveries and a CES showcase toward industrialization. My roots are in hardware (two embedded-systems MSc degrees, an electronics background, a TI analog-design award), so I translate fluidly between hardware, data, and software teams. 13+ years building and years leading engineers (tech lead at Beekeeper, directed a remote team at Obermatt), on AWS with Terraform, Python, and SQL, with pragmatic architecture that fits the stage without overengineering.

WORK EXPERIENCE

LumApps · Senior AI Engineer 03/2026 - Present

Architecture Data Pipelines APIs GCP AWS Python SQL Customer-Facing Product

- Own a customer-facing product end to end on GCP: architecture, data pipelines, and rollout from discovery to production, reporting to C-level.
- Built data pipelines from event-driven ingestion (Pub/Sub) into a usable data and knowledge layer the product acts on.
- Stay deeply hands-on: design and implement, decide when to iterate, fix, or rebuild, and lead debugging myself.

Beekeeper AG · Senior Software Engineer (Technical Lead) 03/2020 - 02/2026

Team Leadership Architecture AWS Kubernetes Data Platforms Kafka PostgreSQL ClickHouse SQL Java Python CI/CD

- Led and grew the engineering team as tech lead: hired and mentored the AI cohort (deputy tech lead of FUEL) and led 3 teams, giving each engineer context, ownership, and a growth path.
- Owned architecture and built data platforms at scale (Kafka, PostgreSQL, ClickHouse, Elastic Search) for products used by 10M+ users on AWS and Kubernetes.
- Shipped fast and pragmatic: replaced \$337K in cost with an LLM pipeline in 6 weeks, deciding when to iterate, fix, or rebuild rather than overengineer.
- Made build-vs-buy calls, kept quality high as deployments scaled, and owned reliability and on-call.

Tenity · Startup Mentor & Technology Evaluation Panelist 06/2024 - Present

Architecture Build-vs-Buy Scalability Technical Advisory Early-Stage

- Advised 20+ startups on pragmatic architecture, scalability, and build-vs-buy decisions at an early stage.
- Mentored founding teams on turning messy inputs into clear technical direction.

Dronistics · Founding Engineer 08/2018 - 03/2020

0-to-1 Hardware-Software IoT & Sensors AWS Terraform Data Pipelines APIs Vue Real-time Systems Industrialization

- Took an autonomous sensor-and-drone system from 0 to 1: built the cloud backend (AWS), data pipelines from sensor ingestion to usable outputs, APIs, and the MVP frontend.
- Deployed in the field with real clients: 500+ deliveries, 99.5% safety record, partnerships with Unilever and a CES showcase, with support toward industrialization.

EPFL, Laboratory of Intelligent Systems (Robogen) · Research Engineer 08/2016 - 07/2018

Hardware-Software Robotics AWS Data Pipelines C++ Python

- Built Robogen, a platform that co-evolves robot bodies and controllers: deep hardware-software systems work, from physical robots to control software.
- Scaled the simulation and data pipeline on AWS. Secured AWS Cloud Credits for Research; featured on the AWS Public Sector Blog.

ENTREPRENEURIAL PROJECTS

Independent practice: I embed with teams, take products from prototype to production, and make pragmatic architecture calls that fit the stage, then codify each build into reusable modules and reference architectures. I run my own cloud, data pipelines, and deploys, staying hands-on end to end.

- Own the full loop solo, from architecture and data pipelines to shipped product, deciding what to build, keep, or rebuild without overengineering.

A real-time analytics platform built solo: data ingestion pipelines, an analysis and signal layer, and a customer-facing frontend where users access and act on the data. Data-as-a-service where the outputs are explainable, not black-box. Live users on real-time feeds.

A pipeline that turns raw field inputs (inspection photos) into structured, queryable data, then into usable outputs: a vision layer extracts signals and agents generate publish-ready content. Sensor-style ingestion to usable output, shipped end to end on one platform.

EDUCATION	CERTIFICATES	AWARDS
Quantic School of Business and Technology2019 - 2020 MBA Business Administration	Building Modern Java ApplicationsAWS Build LLM Apps with LangChainDeepLearning.AI MongoDB for Java DevelopersMongoDB University Microsoft Certified Professional (MCPS)Microsoft	TI India Analog Design Contest WinnerTexas Instruments Recognized for innovative analog hardware circuit design AWS Cloud Credits for ResearchAmazon Web Services (2020) Appreciation from John T. Chambers (ex-CEO, Cisco Systems)Cisco Systems Recognized for contributions to strategic projects within Cisco's ecosystem KTH Opportunities FundKTH Royal Institute of Technology
