Dear hiring team,

This role reads like the job I already do: take model capability and turn it into something that holds up in everyday use, not just in a demo.

At LumApps I own AI agent delivery end to end. Multi-agent workflows on Python, LangGraph and Google ADK over Vertex AI, with tools over MCP and state streamed to the UI over AG-UI. The hard part is not the model, it is everything around it: prompts, tools, memory, verification loops, and evals that reflect how reps actually work. That system now doubles open rates, doubles approved opportunities, saves reps 2 to 3 hours a day, and forecasts \$1M in quarterly revenue. On top of it I built AI Brain, a temporal knowledge graph on Graphiti and Neo4j that unifies 5+ silos into one time-aware memory every agent reads and writes, so retrieval is grounded and hallucinations drop.

Before that at Beekeeper I replaced a \$337K annual vendor translation contract with an LLM pipeline I designed and shipped in 6 weeks, then kept it running. 12K+ assets translated, product team iterates without external gatekeepers. I ran observability and global on-call for the systems I built, so diagnosing across model, orchestration, and infra layers is a reflex. On the side I run Anand Creations, my own forward deployed practice and the home for AI products I ship myself (PulseView, Proplab, SwissNRI). The PoC-to-production motion is a habit, not a stretch.

My ML grounding goes deeper than LLM APIs. At EPFL I engineered Robogen, an open-source platform for co-evolution of robot bodies and neural controllers via genetic algorithms, scaled on AWS and featured on the AWS Public Sector Blog. Optimization, search, and learning from environment shape how I think about modern agents.

I am Zurich-based, product-minded, and default to shipping, measuring, and refining rather than polishing. Small senior teams with fast shared decision-making are where I do my best work. I would welcome the chance to talk.

Thanks for reading,

Anand Bhaskaran
