Dear Arize team,

I am the buyer you sell to. Right now I run a production multi-agent system at LumApps on Python, LangGraph, Google ADK and MCP over GCP Vertex AI, and I lean on AI observability (LangSmith today) every single day. Evals-as-tests, tracing across tool calls, cost-per-request telemetry: I have the muscle for the exact conversation your prospects want to have. Reading the Arize AX pitch, my instinct is not "explain this to me", it is "here is where I would put this in front of my last three CDO buyers".

The systems are working. 2x open rates, 2x approved opportunities, \$1M/quarter forecast revenue. What made those numbers land was the observability discipline underneath: a temporal knowledge graph that stamps every agent read/write with a source and a timestamp, evals that catch regression before a customer does, and a cost dashboard C-level actually opens. When I demo Arize, I am not selling a category I read about, I am selling the muscle a small team needs to ship production AI without praying.

The sales-engineering motion is not new either. Six years at Beekeeper co-owning GTM launches with Product and Sales (one became the top revenue channel: \$1.5M+ generated, \$500K ARR). Two years advising 20+ fintech and AI startups at Tenity: discovery on their GenAI stack, technical POCs, translation between engineers and non-technical stakeholders. And Anand Creations, my independent forward-deployed practice, is the same motion under my own shingle: embed, discover, prototype, ship. Small culture-fit nod: I started at Dronistics, an EPFL autonomous drone spin-off, which I noticed sits inside your team's origin story.

I am Zurich-based, EMEA-remote-ready, and happy to travel across the region for customer engagements. Would love to talk about the EMEA accounts where you need someone who can hold both a CDO pitch and a hands-on PoC in the same afternoon.

Thanks for reading,

Anand Bhaskaran
