Dear Caplena team,

I already work as a Forward Deployed Engineer, just under my own shingle. Anand Creations is my independent FDE practice: embed with a team, run technical discovery, build the integrations and data flows, ship, and stay on for the debugging. Caplena's role is the same motion at a real product with real DACH enterprise customers, on a stack I already run in production.

The development slice lines up cleanly. At LumApps I own a production multi-agent system in Python on GCP Vertex AI, with tools exposed over MCP servers I authored and OAuth/REST/webhook integrations into Salesforce, HubSpot and Pendo. Data lives in PostgreSQL and Neo4j; I designed a temporal knowledge graph that unifies 5+ enterprise silos so every agent reads from one clean, time-aware source. 2x open rates, 2x approved opportunities, \$1M forecast quarterly. When it broke I was the one who fixed it and wrote the postmortem.

The customer-facing and debugging slices are where I spent most of my six years at Beekeeper. I shipped the Employee Referral System end-to-end (top revenue channel, \$1.5M+ generated, \$500K ARR), built an AI Onboarding Specialist that guided 100% of new signups without added headcount, and ran a \$337K/year vendor translation contract into a 6-week Python + OpenAI pipeline. I also ran observability and on-call across ClickHouse, PostgreSQL, Elastic Search on Kubernetes, so reproducing a messy customer bug from logs is a comfortable place to be.

Your stack (GCP, Claude, Kubernetes, PostgreSQL, ClickHouse) is my daily stack. I am based in Zurich, comfortable with remote-first, and used to explaining technical work directly to executives and end users without a middle layer.

Would love to talk about the customer accounts where you most need someone who can go from a call to shipped integration without hand-holding.

Thanks for reading,

Anand Bhaskaran
