Dear Google Cloud Hiring Team,

I ship production agentic AI into live enterprise environments on GCP and stay accountable for the number it moves. That is the job as I read it, so I will keep this short.

At LumApps I am the Founding AI Engineer on the GTM team, embedded with Sales and Marketing to build the outbound sales agents on Vertex AI. I ran the discovery interviews with C-level, translated what the models could and could not do into a roadmap they signed off on, and took the system from prototype to production: multi-agent workflows on LangGraph and Google ADK using ReAct, self-reflection and hierarchical delegation, tools exposed over MCP servers, agent state streamed to the UI over AG-UI. Open rates and approved opportunities doubled, and the forecast is \$1M in quarterly revenue. Under the agents sits an AI Brain I designed, a temporal knowledge graph on Graphiti and Neo4j with vector search, fed structured and unstructured data from Salesforce, HubSpot, Pendo, transcripts and product usage over Pub/Sub, so every agent reads one time-aware memory that grounds its RAG. Each release ships with eval pipelines, granular tracing, and latency and cost-per-request telemetry.

Before that, at Beekeeper, I replaced a \$337K annual vendor contract with an in-house LLM pipeline in 6 weeks, wired a GenAI demo system into Salesforce and live customer data, and hired and mentored the AI engineering cohort so the practices outlived me. I ran observability and on-call for systems I architected on a platform serving 10M+ users. I hold an MBA, have founded three companies, and still build and ship my own AI products through Anand Creations on the side.

The Senior Staff level asks for things I already do: own the hardest engagements, set technical direction across teams, co-build with the customer's engineers until they can run it without me, and turn what the field teaches into reusable modules and product asks. I am based in Zurich and would like to do that with Gemini, Vertex AI and Google's customers.

Thanks for your time. I would welcome the chance to talk.
