Dear Loopia team,

Your ad reads like a description of how I already work. Own the product end to end, ship early, trust customers over opinions, and have an actual system for building with agents. I have been doing exactly that at LumApps, at Beekeeper before it, and at three products I founded on the side.

The "real system for agentic development" is the part I most want to prove up front. I have written it down. My blog and TowardsAI piece walk through the same stack I use daily: how I structure context (a temporal knowledge graph I designed at LumApps to ground every agent), how I iterate prompts against real usage, how I design tools over MCP so agents can act without going off-script, how I run lightweight evals and cost-per-request tracing in production, and the verification loops that keep an autonomous agent from doing the wrong thing in front of a customer. I switch models and harnesses when something better shows up (LangGraph, Google ADK, MCP, AG-UI, Claude and GPT side by side) because what ships and holds up is the only thing that counts.

On product sense and customer fluency: at Beekeeper I architected the Employee Referral System that became the platform's top revenue channel (\$1.5M+ generated, \$500K ARR) because I shipped what customers actually paid for, not what the roadmap said. As founding engineer at Dronistics I put prototypes in front of Unilever and turned each meeting into the next opportunity, ending at a CES showcase. I have the founder-like default: pick up whatever the business needs that week and stay on the hook when it goes live.

I am Zurich-based, want to be in the same room, and would love the responsibility Loopia is offering. Happy to send a repo, a demo, or a walkthrough of my agent stack whenever you want it.

Thanks for reading,
Anand Bhaskaran
