Dear Luware team,

The AI Transformation Engineer brief describes the work I already do. At LumApps I own group-wide AI transformation end to end: run use-case discovery with Sales, Product and RevOps, prioritize the roadmap, prototype fast, ship to production, then report adoption and impact directly to C-level.

The proof point is the AI outbound system I built there. Multi-agent workflows on Python, LangGraph and Google ADK, with tools over MCP and state streamed to the UI over AG-UI, on top of AI Brain, a temporal knowledge graph on Graphiti and Neo4j that unifies 5+ silos into one time-aware memory for RAG. Result: 2x open rates, 2x approved opportunities, 2 to 3 hours saved per rep per day, \$1M forecast in quarterly revenue. The reference architecture the rest of the org now builds on.

Before LumApps I ran the same motion at Beekeeper: replaced a \$337K annual vendor translation contract with an in-house LLM pipeline shipped in 6 weeks, built and mentored the AI engineering cohort, co-owned GTM launches with Product and Sales so every AI feature landed with adoption metrics and impact reporting. That is the transformation loop the JD asks for: identify the use case, ship the prototype, roll it out, measure adoption, iterate.

Two honest notes on stack. My deep production work is on GCP Vertex AI, OpenAI APIs and open-weight models rather than the full Microsoft AI stack; I know M365 as a user and I hold the older MCPS certification. Azure OpenAI wraps the OpenAI API I already use daily, and I pick up new stacks fast (I taught myself LangGraph, ADK, MCP and AG-UI in the same year to ship the system above). If a Customer Zero for Microsoft profile needs prior Copilot Studio and Power Platform depth from day one, I am the wrong fit; if the bar is a proven AI transformation practitioner who will ramp on the Microsoft stack quickly, I would love the conversation.

Thanks for reading,

Anand Bhaskaran
