Dear Swiss Re team,

Insurance is one of the oldest bets in capital markets and reinsurance is where the tail lives. I have spent the last decade engineering, founding, and investing off the standard path, and I want to bring that combination into a business whose whole job is pricing what most people would rather not think about.

I am Lead AI Engineer at LumApps, where I own the AI stack end to end: multi-agent workflows on Python, LangGraph and Google ADK over GCP Vertex AI, tools exposed over MCP, grounded by a temporal knowledge graph on Graphiti and Neo4j that gives every agent one time-aware memory across Salesforce, HubSpot, Pendo and product data. MLOps discipline is built in from day one, not bolted on: evals, agent tracing, model and prompt versioning, cost-per-request telemetry, per-agent access contracts, on-call for global production. Outcome so far: 2x open rates, 2x approved opportunities, \$1M forecast in quarterly revenue. Before that at Beekeeper I replaced a \$337K annual vendor contract with an in-house LLM pipeline in six weeks, kept it running, and hired and mentored the AI engineering cohort that now leads features independently.

The part I do not usually put on a CV: I invest my own capital and I think about risk professionally. Early positions in Anthropic, OpenAI, SpaceX and Polymarket, alongside a capital-markets portfolio built to compound over decades, not quarters. I read S-1s and reinsurance treaty structures for fun, study Ray Dalio, Warren Buffett and Charlie Munger (Berkshire is a reinsurer for a reason) the way most engineers study framework release notes, and spend evenings running risk optimisation and portfolio allocation with my own AI systems. I have also co-founded three companies, most recently SwissNRI, an AI-native cross-border tax and compliance platform where regulatory guardrails were built before features, not after. That risk lens changes how I engineer: I ask what the tail looks like before I ship, kill features that will not compound, and instrument every launch so we know within a week whether it is worth another dollar.

An AI Engineering Lead seat at Swiss Re looks like the rare place where the AI engineering I do at work talks directly to the risk and capital thinking my brain already runs on. I would love the chance to talk.

Thanks for reading,
Anand Bhaskaran
